Canary Enterprise Historian ODBC

Easy Access To Historical Data Via ODBC

The Canary Historian ODBC Client is a driver that allows ODBC-compliant applications to use the Open Database Connectivity (ODBC) standard to access the Canary Enterprise Historian. It provides a relational database view of the data, allowing the use of SQL queries. This allows access to the Canary Enterprise Historian data for a large number of existing third-party query and reporting tools that are used for data analysis and reporting.

This driver is used to create an ODBC Data Source. Such data sources can be set up for a single user or for all users on a computer. Each Data Source can access a single Canary Enterprise Historian – either on the same computer or remote access.

Key Features

- Supports standard SQL queries
- Data can come from local or remote historians
- Easily installed and configured through standard Windows ODBC utilities
